Keep your slides. Add the room.

You are presenting. Instead of asking a question into silence, every phone in the room answers at once, in whatever language its owner thinks in, and one result lands on the screen while you keep talking.

The presenter view during a live question: 24 phones, three languages, one bar chart.

Nothing to install

People join in any browser with a six-digit code or the QR. No app, no account, no email.

Your slides stay yours

PowerPoint, Google Slides, Keynote or Teams. Nabad sits beside them, on a slide or on top of it.

Eighty-six languages

Everyone reads the question in their own language. You read one combined result.

1 Build it the day before

Title, languages, three to five questions. The session waits in Drafts until you start it.

2 Press Present

The room opens. Put the code on the screen, or the live results straight on your slide.

3 Close the room

You get a recap with every answer, the language mix and a CSV. The session stays in Past.

Six pages, in the order of a real session.

Before, during with your slides open, what the audience sees, after, and how to make the most of a room that speaks several languages.

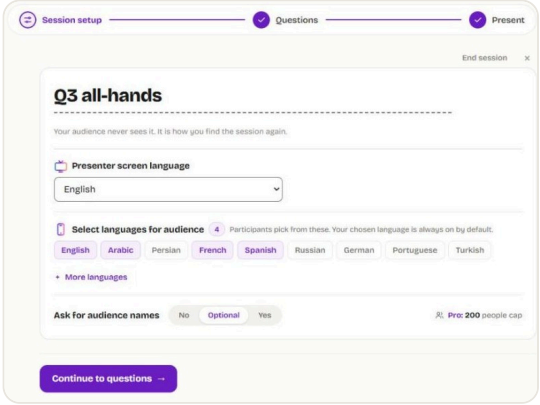

nabad.live

THE DAY BEFORE

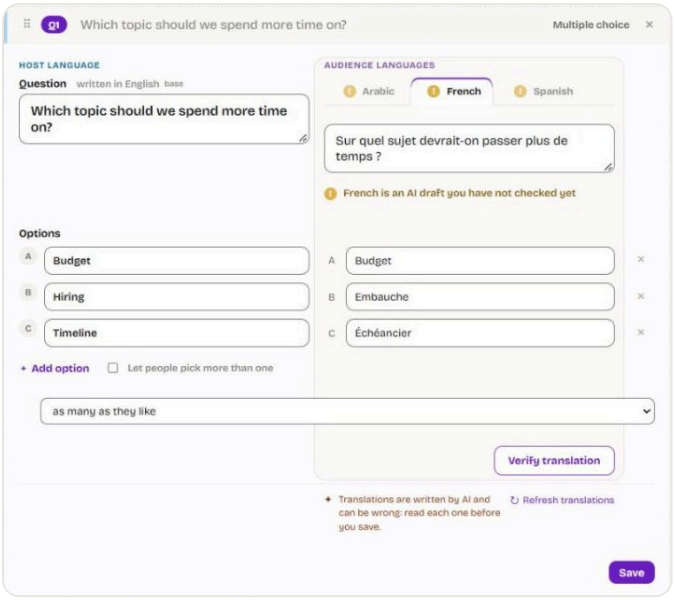

Build the session in the editor

About ten minutes the first time. Everything here can be done days ahead, from any computer.

1. On the dashboard press **New session**. A live session happens in real time; a survey runs on its own. For a presentation you want the live session.
2. Give it a **title**. Your audience never sees it; it is how you find the session again.
3. Pick the **Presenter screen language**, the language you will read results in, and the **languages for audience**. Add every language you expect in the room. People pick one when they join.
4. Decide whether to **ask for names**. Optional is the default: a name shows beside answers on your screen, never on the room screen.
5. Press **Continue to questions** and add three to five. A single choice poll, a word cloud and a Q&A carry most presentations.
6. When each card shows **Verified** for every language, press **Continue to present**. The session stays in Drafts until you press Present.

Step 1, Session setup: the title only you see, the language of your screen, the languages your audience may answer in.

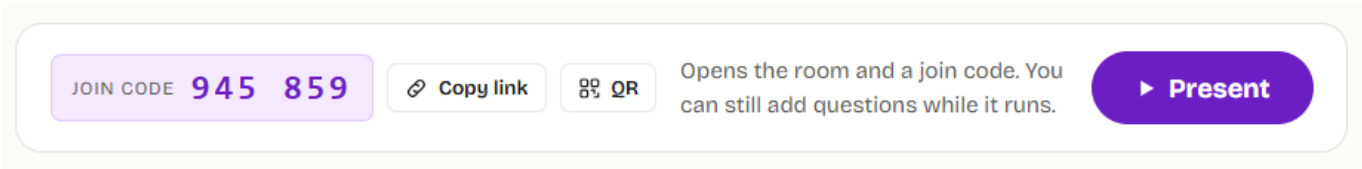

A question card. You write once, on the left. Nabad drafts the other languages on the right, and each one waits for your check.

Nabad will not let you present an unchecked translation

Every language on a card starts as an AI draft with an orange mark. Read it, fix it if needed, press **Verify translation**. Press Present with a draft still open and the editor brings you back to that card.

The code works before the session does

Someone who types the code while the session is still a draft reads that it has not started yet. Nothing is lost: they are in as soon as you press Present.

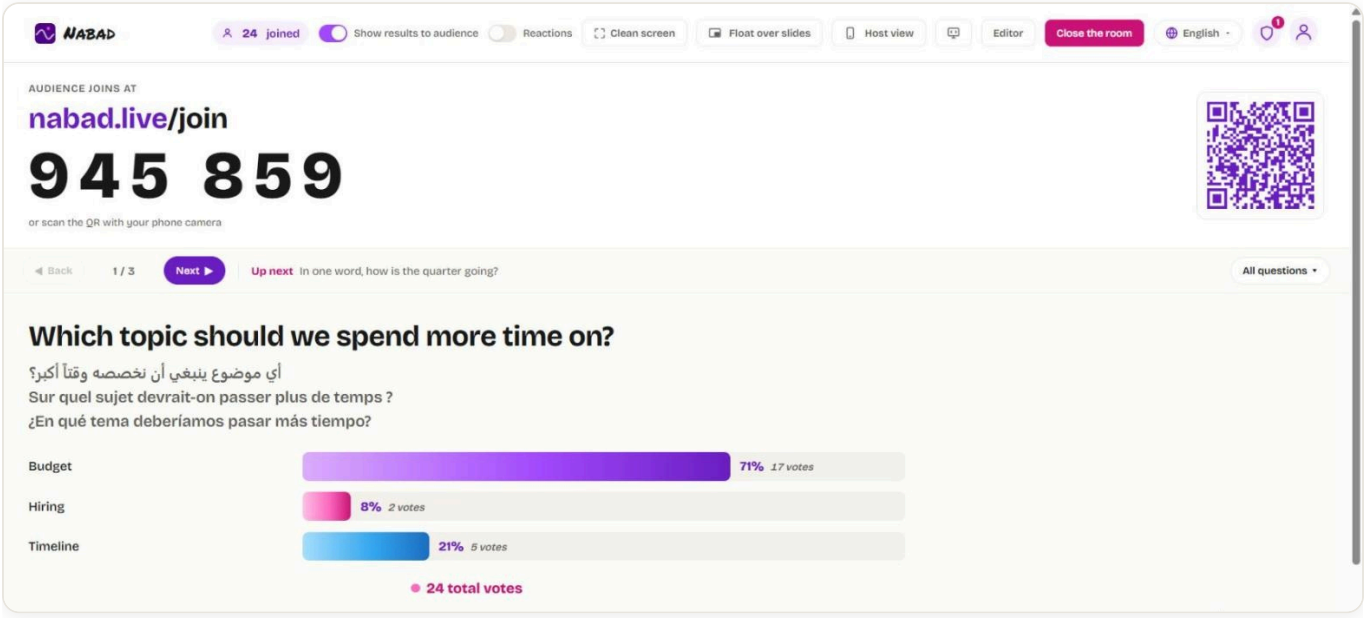

Step 3, Present: the six-digit code exists from the moment the session is created, so you can print it on a slide the day before.

THE DAY OF

One screen to run the room from

Press Present, on the session card or at the end of the editor. The room opens and this view is yours. Nothing shows on the phones until you press Start.

The presenter view. Top bar: who joined, Show results to audience, Reactions, Clean screen, Float over slides, Host view, Embed, Editor, Close the room.

CONTROL	WHAT IT DOES
Start, Next, Back	Move through your questions. Every phone follows. All questions jumps to any of them.
Show results to audience	On by default. Turn it off while people answer, so nobody votes with the crowd, then turn it on to reveal.
Clean screen	Hides every button. For a projector that shows Nabad itself. Move the mouse to get them back, Esc to leave.
Float over slides	A small always-on-top window with the code, the QR and the live results. For a laptop that is also running your slides.
Host view	Puts Next, AI insights and flagged questions on your phone, off the shared screen.
Embed (screen icon)	The room screen link, for a slide or a Teams tab. Page 4.
Close the room	Ends the session and opens the recap. A live room also closes itself 24 hours after it opened.

Your clicker works here too

In Clean screen the arrow keys and Page Up and Page Down move between questions, which is what a presentation remote sends. I opens and closes AI insights.

POWERPOINT, GOOGLE SLIDES, KEYNOTE, TEAMS

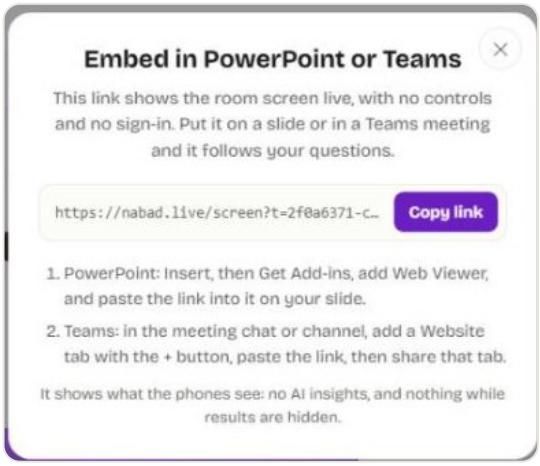

Three ways to present with your slides open

Pick one per talk. All three use the same room; the difference is where the results appear and what your hands are doing.

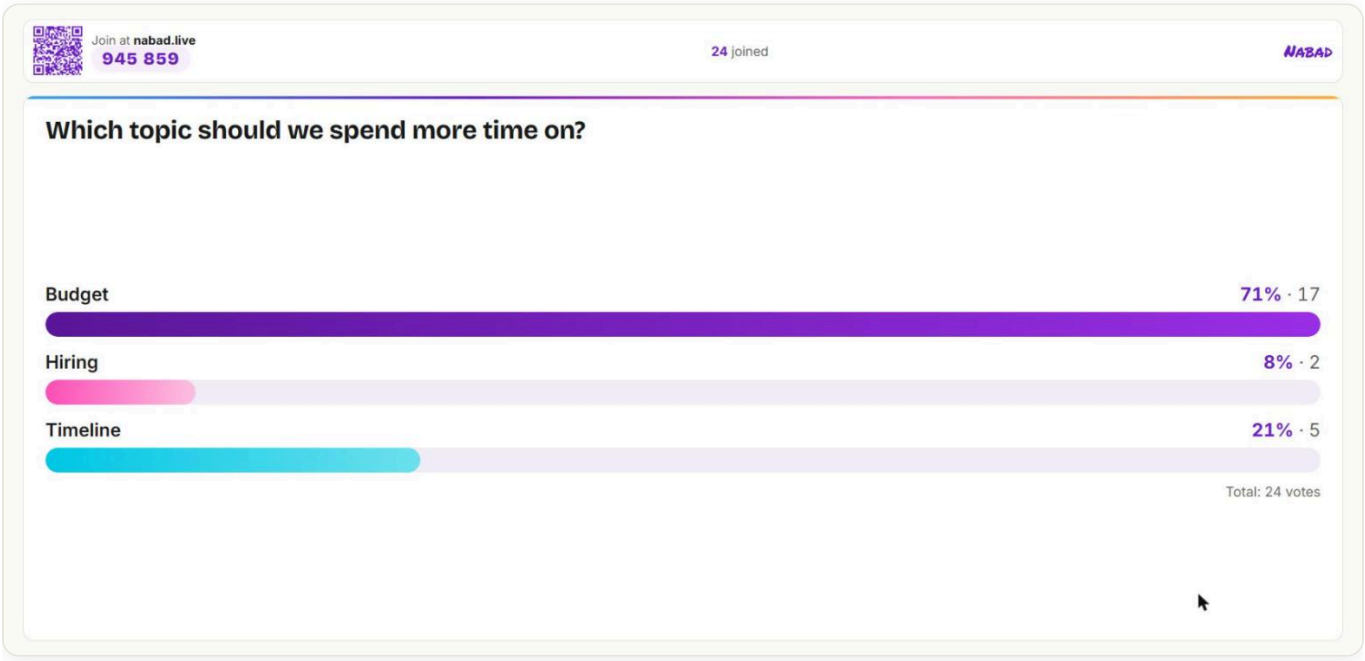

The results live on a slide POWERPOINT, TEAMS

1. In the presenter view press the screen icon, **Embed in PowerPoint or Teams**, and copy the room screen link.
2. In PowerPoint: Insert, Get Add-ins, search for **Web Viewer** and add it to the slide. Paste the link into the box and stretch it to fill the slide.
3. Start the slide show. The slide shows the join code, the question you are on and the results as they arrive. Move to your next question from the presenter view, or from your phone, and the slide follows.

In Teams: in the meeting chat or a channel, add a Website tab with the + button, paste the same link, then share that tab. Everyone in the call sees the room screen.

The Embed dialog gives you the room screen link. It belongs to this session and never expires.

The room screen: what a PowerPoint slide shows once the link is in it. The join code, the question, the results, and not one button.

TWO MORE WAYS

When the results cannot live on the slide

Google Slides and Keynote cannot show a live page inside a slide, and sometimes you simply want the projector on Nabad. Both of these keep your hands free.

A small window on top of your slides

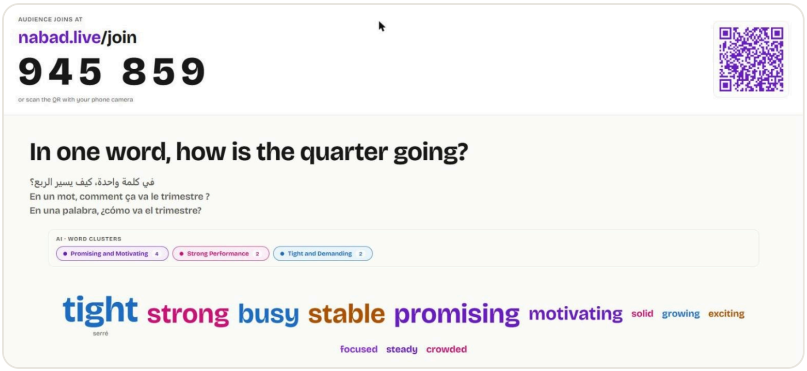

ANY SLIDE TOOL

Press **Float over slides**. A window the size of a sticky note opens with the QR, the code and the live results, and stays on top while you present from PowerPoint, Google Slides or Keynote on the same laptop. The room sees it on the projector. Close it when you want your slides alone.

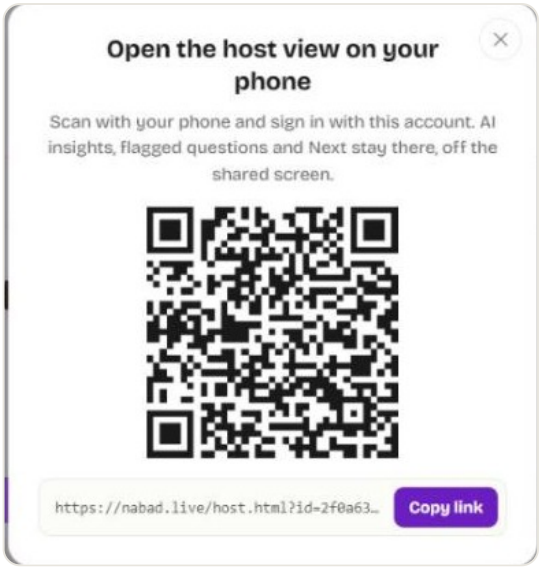

The projector shows Nabad, your phone drives

GOOGLE SLIDES, KEYNOTE

When the slide tool cannot hold a live page, put a short link on the slide, **Live results**, pointing at the room screen link. Click it during the show: the room screen opens full screen, and you come back to the slides when you are done. Or project the presenter view in Clean screen and keep **Host view** open on your phone: Next, AI insights and flagged questions stay in your hand, off the wall.

Clean screen: the same view with every button hidden. This is what you project when the projector shows Nabad itself.

Host view: scan with your phone and Next, AI insights and flagged questions move to your hand.

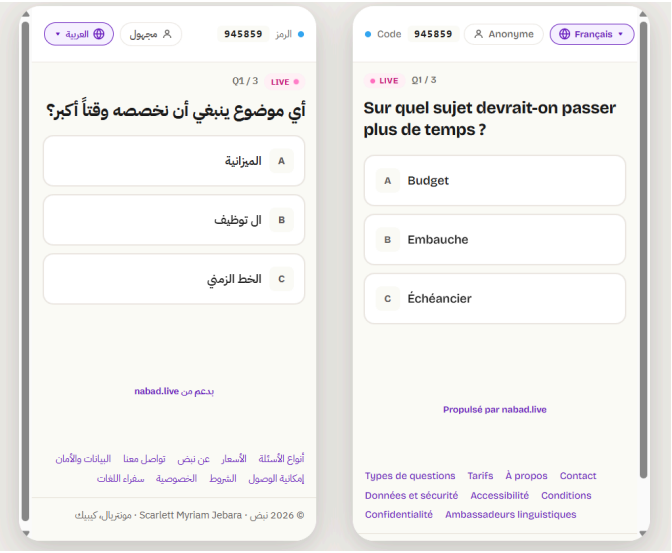

Can someone with the link take over?

No. The room screen link only shows what the phones already see. Moving between questions, hiding results and closing the room need your login. The link is on every plan, including Free.

IN THEIR HANDS

What the audience sees

They scan the QR or type the code at nabad.live/join. Then they pick a language, once, and the session is in it from that moment.

Two phones in the same room on the same question, one in Arabic, one in French. Each picked its language once, on joining.

- **Any phone, any browser.** Nothing to install and no account. A laptop or a tablet works the same way.
- **The language is theirs.** The question, the options and every button appear in the language they chose, including right-to-left scripts. They can change it from the top of the screen.
- **One answer per person per question.** The phone moves to the next question when you do, and shows the results when you reveal them.
- **Names are optional.** Unless you set names to Yes in Session setup, anyone can press Stay anonymous.

A seat is a seat

A person who answers all five of your questions counts once toward the plan cap. If your room is bigger than your plan, the presenter view warns you well before the room is full.

AFTER THE TALK

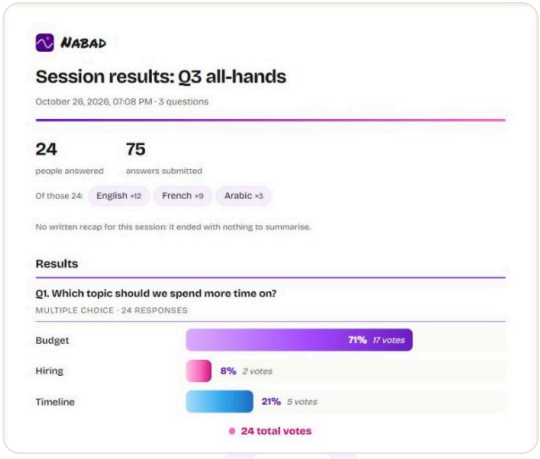

Close the room, keep everything

One click ends the session. Nothing is deleted: the session moves to Past on your dashboard and the recap stays there.

1. Press Close the room in the presenter view and confirm. The phones show that the session has ended.
2. The **recap** opens: how many people answered, in which languages, every result, and for open answers a short written summary.
3. Press Answers (.csv) for every answer in a spreadsheet, or Print or PDF to keep the page.
4. To run the same session again, open its card menu on the dashboard and press Duplicate. You get a fresh draft with the same questions and a new code.

If Present will not start

Your email is not confirmed yet. Or a translation on a card is still a draft. Or someone typed a letter into the code, which only ever has six digits.

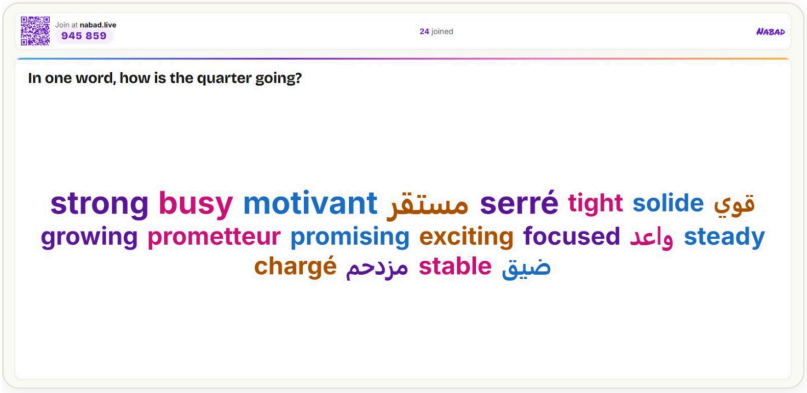

The recap page, the moment the room closes: who answered, in which languages, every result, a CSV and a print button.

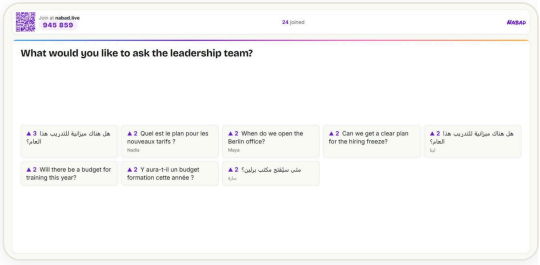

THE POINT OF NABAD

Tips for a room that speaks several languages

This is where Nabad stops being a polling tool and becomes a way to hear the whole room. A few habits make the difference.

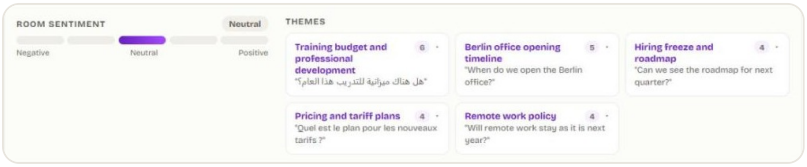

The room screen on a word cloud. Words arrive in three languages and sit side by side.

The room screen on a Q&A. Questions keep their language on the wall. The presenter view shows you each one translated.

- **Add more languages than you think you need.** An unused language costs nothing. A missing one leaves someone answering in their second language, or not at all.
- **Check the drafts in the languages you read, and trust the mark in the others.** Verified means a human looked. If a colleague speaks the language, hand them the editor for two minutes.
- **Read the question out loud in the room language, then wait.** People reading a translation need a second longer. Turn Show results off until most phones have answered.
- **On a word cloud, say "one word".** Half the room writes a sentence otherwise. Words arrive in every language and sit together on the wall; the presenter view groups them for you.
- **In a Q&A, read the translation, answer in your language.** The wall keeps each question as it was typed. Your presenter view shows you the translation underneath, with the language tag.
- **Look at the language mix in the recap.** It tells you who was in the room in a way a headcount never does.

AI insights on the presenter view only: room sentiment and the themes across all the questions, whatever language they came in.

AI insights, on Pro

For open text, Q&A and word clouds, the presenter view can show the room sentiment and the themes across every language at once. It opens with `I` and never goes on the room screen or the embedded slide. The free plan shows the answers; Pro adds the reading.

Questions, or a room we have not thought of?

Write to us. Every page of the site, and this guide, exists because a host told us what happened in theirs.
